MINERALIGHT[®] LAMPS

OFFER YOU EXCLUSIVE FEATURES FOR FIELD OR HOME DISPLAY

- Multi-Band MINERALIGHT Lamps—give short wave and long wave separately, as well as together, to fluoresce all fluorescent Minerals.
 - MINERALIGHT Short Wave Lamps have high intensity for stronger fluorescent of Minerals that respond best to short wave. This includes approximately 90% of all fluorescent Minerals, including all the important ones from Franklin, N. J.
Multi-Band and Short Wave MINERALIGHT Lamps come in three styles.
 - Transistorized M-Series Portables—Weigh 1½ pounds including Battery.
 - Plug-In U V Series Hand Lamps—adaptable for Field Use.
 - Display—C S Series Lamps—small and large displays.
-

Ask for a copy of the all-new MINERALIGHT Lamp Catalog, with full color photos of Minerals in both White light and Ultra Violet, plus definitions, questions and answers of interest to Rock Hounds.

FRANKLIN UNIQUE IN VARIETY OF ORES

The Town of Franklin's history is based mainly on the unique ore deposits which occur in this area. The only other locality in the mineral world, comparable to Franklin, is an area in Sweden.

Franklin has gained world-wide fame in respect to the large number of minerals that are to be found here. There are in excess of 194 different mineral specimens that have been identified; of these 26 are to be found nowhere else in the world.

The Franklin ore deposits were first discovered in the middle 1600's. These deposits continued to baffle the mining experts for the next two centuries because they were unlike any other known mineral deposits in the world. Its principle metals are zinc, manganese and iron. All three are present as a complex oxide in the mineral known as Franklinite (named in honor of Benjamin Franklin). Zinc is also here as a silicate, known as Willimite (so named in honor of William, King of England), and as an oxide known as Zincite. Some veins contain all three of these minerals in a complex mixture while other veins consist of the three minerals in almost their pure form. The ore body is also quite unique in that it is relatively free from other heavy metals such as lead, cadmium and copper which are usually found in zinc ore deposits.

All attempts to get the Franklin orebody to yield its zinc were unsuccessful and it was not until 1852 that the first satisfactory method of smelting the ores was developed. Since that time, more modern methods of mining and milling have increased to the point where zinc and zinc products are used in almost every phase of modern manufacturing.

Franklin has in recent years become the mecca of the beginner and advanced rock collectors as well as mineralogist. The professional geologist also has a definite interest, in the diversification of minerals to be found in Franklin. Perhaps, one of the main factors of the popularity of Franklin with these rock-collectors is the fact that so many of these minerals are found on the surface of the ground, thus making it a simple matter for the collector to gather his specimens.

The Franklin Mineral Museum, Inc. is located on Evans Street. The Museum Building is of Fireproof construction, and is connected with the Mine Replica and Fluorescent display room. The building contains a lobby with sales facilities, off this are rest rooms, Curator's office, with its library of Franklin Literature and records, a laboratory and preparation room for the identification of minerals.

FRANKLIN UNIQUE IN VARIETY OF ORES

Ample parking is available on the property which overlooks the Upper Wallkill Valley and the noted Buckwheat Open Cut.

To date, a comprehensive collection of Franklin minerals and a large number of pamphlets and other publications, photographs, maps and the like have been received. A years membership card, cost \$5.00, entitles the bearer to unlimited visiting privileges for one year.

Sponsors, Patrons & Donors will receive public recognition on a permanent scroll mounted in the Lobby.
